Lesson 5 Objectives

- Build a productive culture
- Invest in growth and development

Lesson Introduction

According to (Oracle) “a learning culture is a set of organizational values, conventions, processes, and practices that encourage individuals—and the organization as a whole—to increase knowledge, competence, and performance. “High impact” simply describes the idea that the learning culture positively impacts business results” We need more managers and leaders to invest in learning cultures and better help the organisations move towards this culture.

Top learning and development skills to have

Research skills

Make sure that you understand the process of conducting research. It's essential when setting up training materials that you have the most up to date information and that it's relevant to the industry and people that you're training.

Master communicating

Make sure that you understand how to verbally, non-verbally, and visually communicate with the people that you're training. Your language should be impactful but still easy to understand. Make sure that you use the correct selection of colours and pictures when setting up the training materials. You want to make an impact and you can do that by visually displaying the correct message.

Understand the different learning approaches

Take your time to investigate the different methods used by the people that you're training when it comes to learning. Employees use different techniques when learning and this will impact how impactful your training material is. You can use a survey to see what the ideal learning approaches are for the employees and based on that, set up your training materials.

Content creation

It's important to understand how to create the content that you're sharing. According to (talentlms) "Authoring tools are software platforms that let trainers incorporate a variety of media (including video) to create engaging and interactive courses. Some tools even have built-in lesson types to speed up the process. Choose a content authoring tool that's easy to use, has the exact features you need, and plays well with your learning management system (LMS). Your LMS is what will deliver your dynamic courses to your learners."

Video editing software

At Shaw Academy, we make use of video editing software to edit the lessons and then upload the content to the website. In order to add create lessons, you will need to invest in editing training and software. This will help you create lessons that are of good quality and that you can use for current and future training sessions.

Learning management systems

According to (talentlms): "Arguably, the best training tool for any trainer is a Learning Management System (LMS). An LMS is a platform from where you can create courses, manage users, and track the performance of online training. Every trainer should not only know how to use an LMS but should master it. This gets much easier if you or your organization choose a well-engineered and intuitive LMS."

Learning and development tools to know

Please note that these are direct quotes and descriptions regarding the different tools as stated by (Academy, n.d.)

Ontuitive

Ontuitive can help you, train employees, by offering specific information at the right time. Be it to train new hires on your organization's business processes or the days following a process change, Ontuitive provides relevant access to your existing resources.

Whatfix

Whatfix is an electronic performance support platform using which you can provide in-app guidance within your business applications to train and support employees at their point of need.

Especially when your organization is using applications like Salesforce where there are multiple features, constant updates, and features going obsolete, chances are that the employees will get overwhelmed. Moreover, changing your training content from scratch each time can get tedious.

Employees tend to forget most of what they've learned because of the time lag between learning and implementation. With a performance support platform like Whatfix as part of your training tools stack, you can create quick guides that provide concise information to employees with minimal disruption to their ongoing workflow. Any training forgotten won't affect the performance since you are resolving queries with contextual, just-in-time guidance.

Read more about how Corporate Training Needs to be Unified in the Digital Workplace [here](#).

Moodle

Moodle is one of the most popular LMS, and there's a good reason for it.

It is an open source learning platform which makes it one of the most cost-effective training tools. Moodle offers a plethora of customizations and features to help you deliver training. It integrates with almost everything like Office 365, GSuite, Salesforce etc, so trainers can monitor learners' progress, understand and optimize the course from the results, and helps manage employee performance better.

Moodle also has a mobile app which makes it that much easier for training content to be accessed and consumed by employees.

Without a dedicated L&D admin, the task of creating and delivering training via LMS can feel pretty overwhelming or tedious. With Moodle, you can pretty much be self-reliant for most tasks since it is fairly simple and intuitive to use. The learner-centric features topped with a collaborative learning environment makes Moodle a good pick.

And the best part of Moodle is its humongous community where you can share ideas, ask questions, get insights on how others are training employees, and more.

Looop

From the land down under, Looop is a very intuitive LMS platform that enables trainers to deliver online training.

With Looop, it is fairly easy to set up and assign courses to employees and it has a great user experience across all devices like mobiles, tablets, and computers.

Looop is designed to ensure learning can be found quickly and easily and is completely in context to the organization. Especially when employees want to find answers quickly and on their own, Looop's course or resource search will go a long way in increasing learner productivity.

Similar to assigning lessons/questions to employees, you can choose content creators for particular lessons or modules. This makes it extremely easy to collaborate with others and get the knowledge into the employees' hand (and hopefully, head) seamlessly.

Looop allows you to add tests, quizzes, surveys, create events, and more. They are constantly adding new features and are known to have good customer support.

Degreed

Yet another training tool, Degreed is an enterprise learning portal that helps trainers consolidate a large variety of content in one place.

Degreed offers a feature called content pathways which you can custom create. This content pathway is a collection of learning content from any source—books, links, videos, courses, articles, etc—that can be used for sharing knowledge on a particular topic. For example, if you are consolidating training material to teach an employee how to use Salesforce, you can put it all in a pathway no matter the file type and source.

Degreed also offers multi-language support for close to 26 languages so you can create courses in multiple languages. Needless to say, Degreed also has an app which ensures that the learning goes wherever your employee goes.

As recent as last year, Degreed launched a skill certification to measure and score employees' existing skill levels. This can add tremendous value to both the workers and organizations where the former gets to brush up and update on skill levels while helping the latter in better understanding what the employees need to be trained on.

Oh and if you are one of those people who Bookmark/Evernote/Pocket a lot of articles for reading or referencing later, you can check out the Degree Chrome plugin. It lets you directly add articles to Degreed itself.
