

Cloud Architecture

Oracle APEX: Importing data into the cloud

Summary Notes

Contents

- 3 Lesson objectives
- 3 Lesson prerequisites

Lesson objectives

By the end of this lesson, you should be able to:

- Prepare and clean e-commerce data set
- Import data set into Oracle APEX
- Explore e-commerce data set

Lesson prerequisites

Basic knowledge of SQL

SQL (Structured Query Language) is a standard programming language used to manage and manipulate relational databases. It is used to insert, update, and retrieve data from a database, as well as to create, modify and delete database structures such as tables and indexes. SQL allows users to interact with a database in a declarative way, specifying what data they want to retrieve or modify, rather than how to retrieve or modify it.

For this lesson, we will use the sample data set provided by Oracle Tutorial. The required SQL scripts can be downloaded from the following link: <https://www.oracletutorial.com/getting-started/oracle-sample-database/>

Basic experience with a code editor

A code editor is a tool used by developers to write and edit source code. It provides features to make the coding process more efficient, such as syntax highlighting, indentation, code completion, error checking, and debugging. Code editors also often have various customization options, allowing developers to personalize their workspace and make it more suited to their workflow. The main purpose of a code editor is to provide a user-friendly environment for writing, testing, and refining code, making the development process faster and more convenient.

For this lesson, we will use the Microsoft Visual Studio Code editor to review and clean the data set for importing. You can download the code editor from the following link: <https://code.visualstudio.com/download>

Familiar with DDL statements

DDL (Data Definition Language) statements are a subset of SQL commands used to define the structure of a database. They are used to create, modify, and delete database objects such as tables, indexes, constraints, and views. DDL statements are used to define the schema of a database, and thus they have a direct impact on the organization and structure of data stored in the database. As a result, they should be used with care, as any mistakes made while executing DDL statements can result in loss of data.
